

Children and Youth 0-17 Years Old Attached to Primary Care Provided as a Percentage of Children and Youth 0-17, 2020, by FSA

Northern Ontario

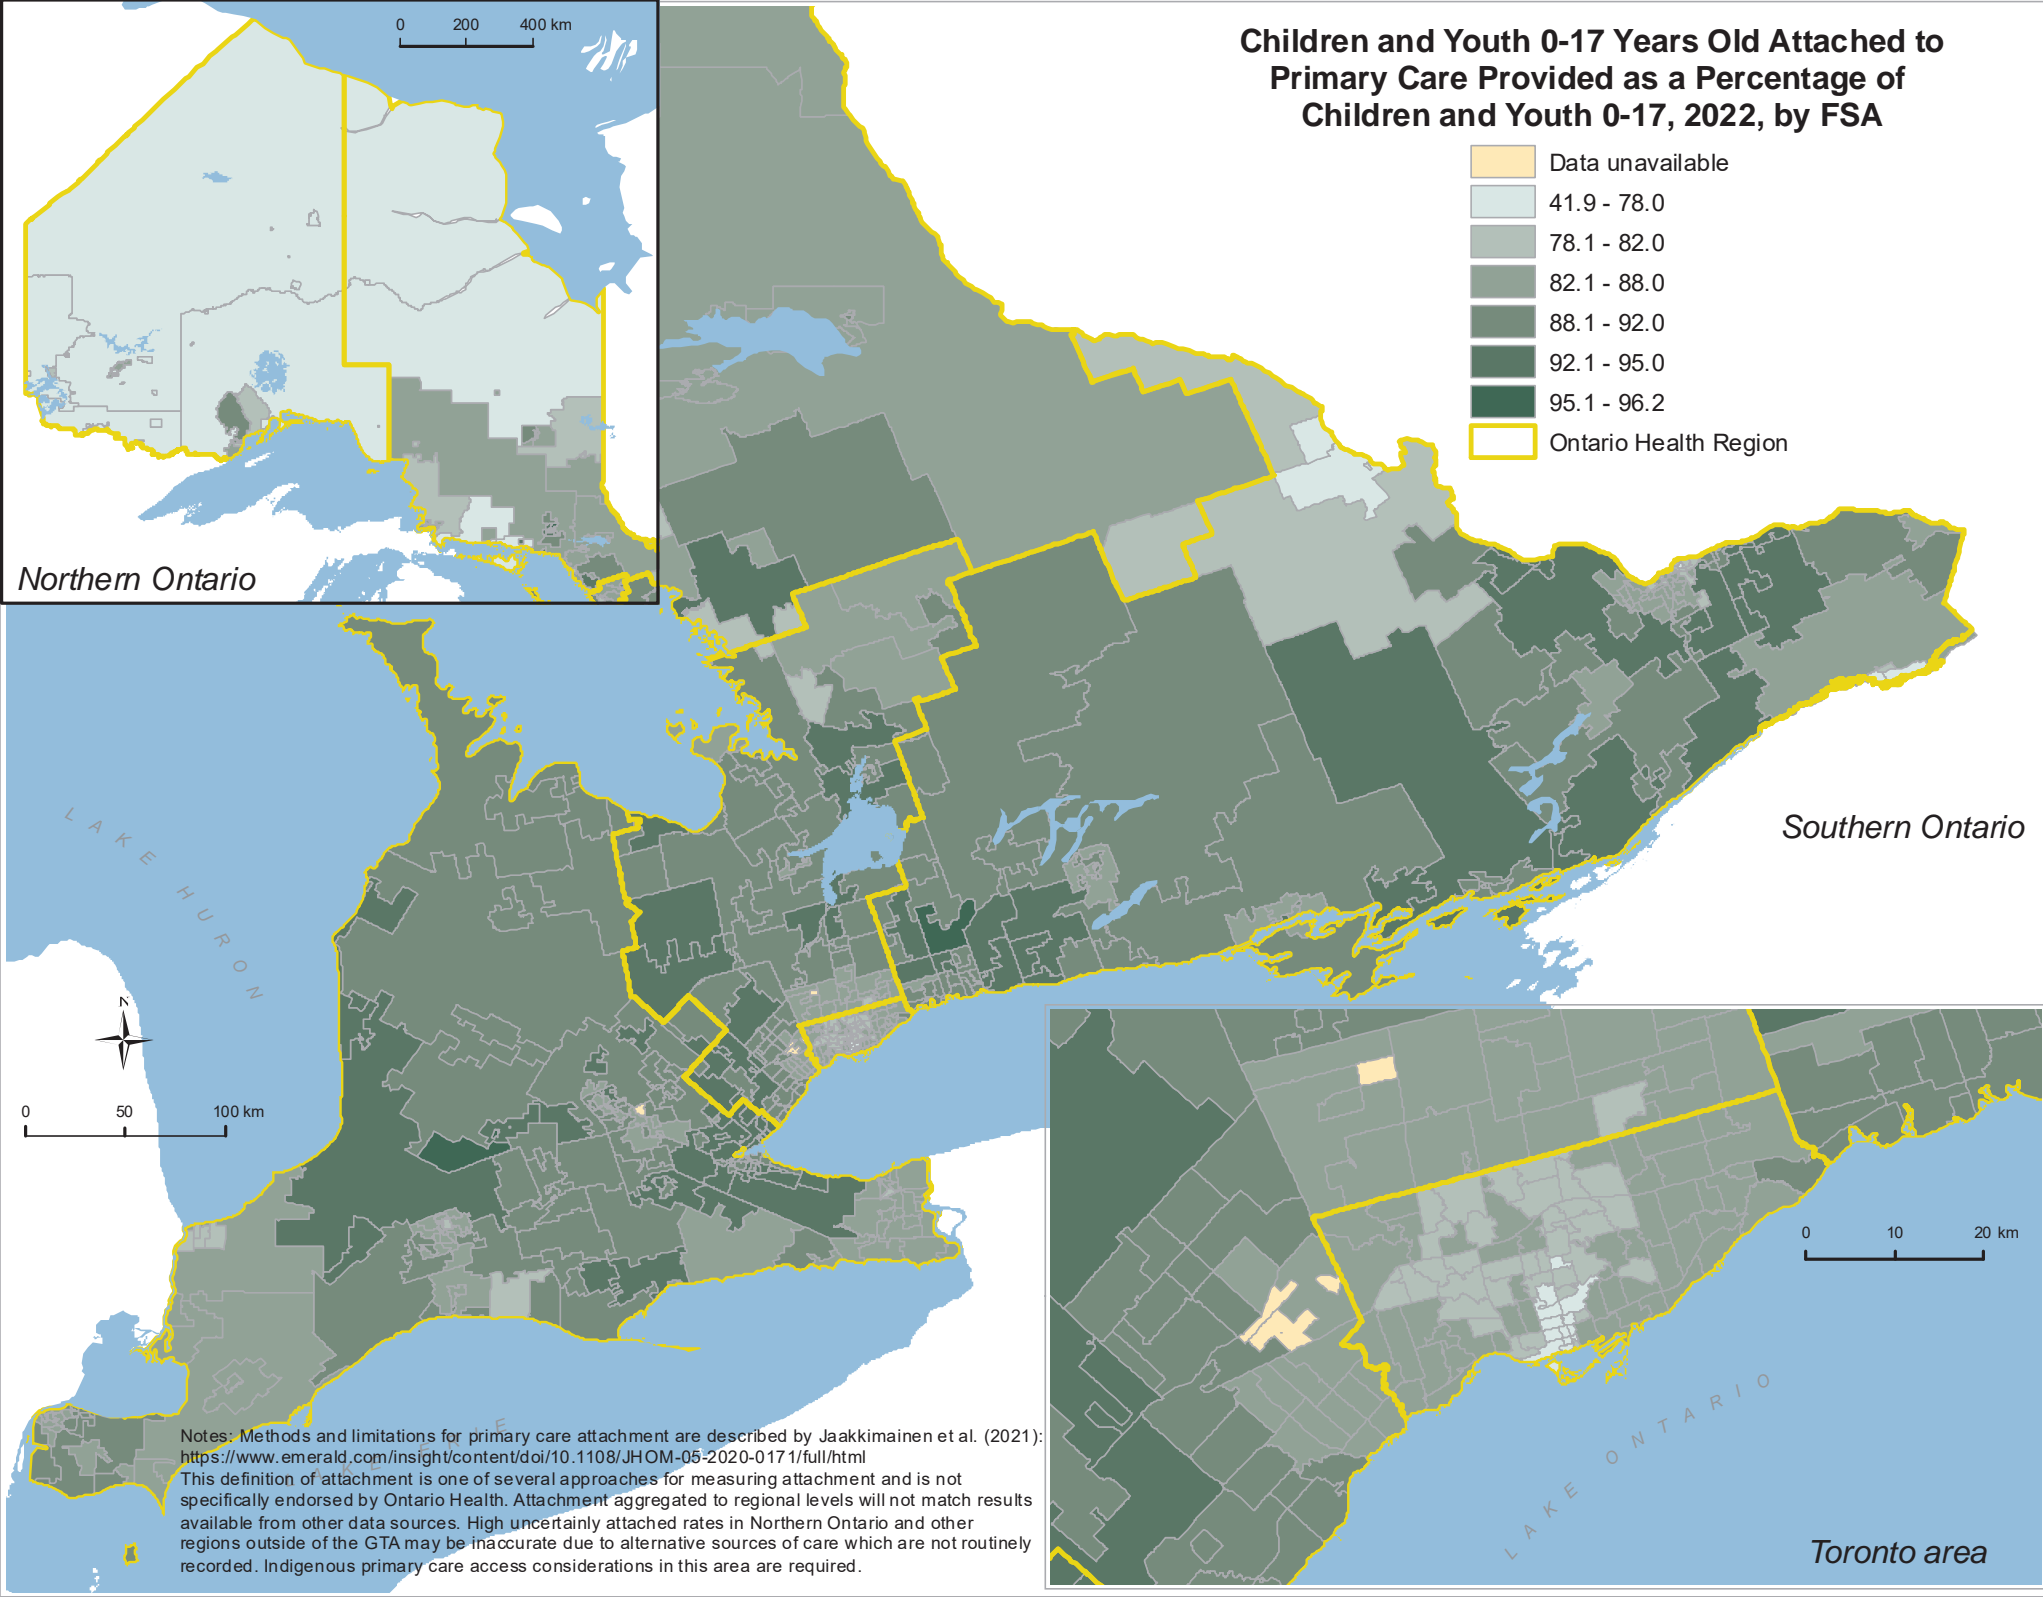

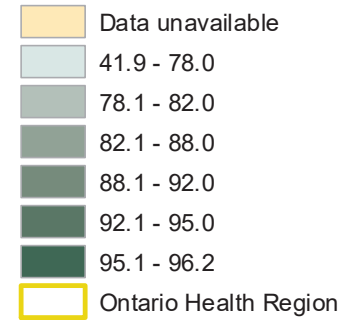

Southern Ontario

Toronto area

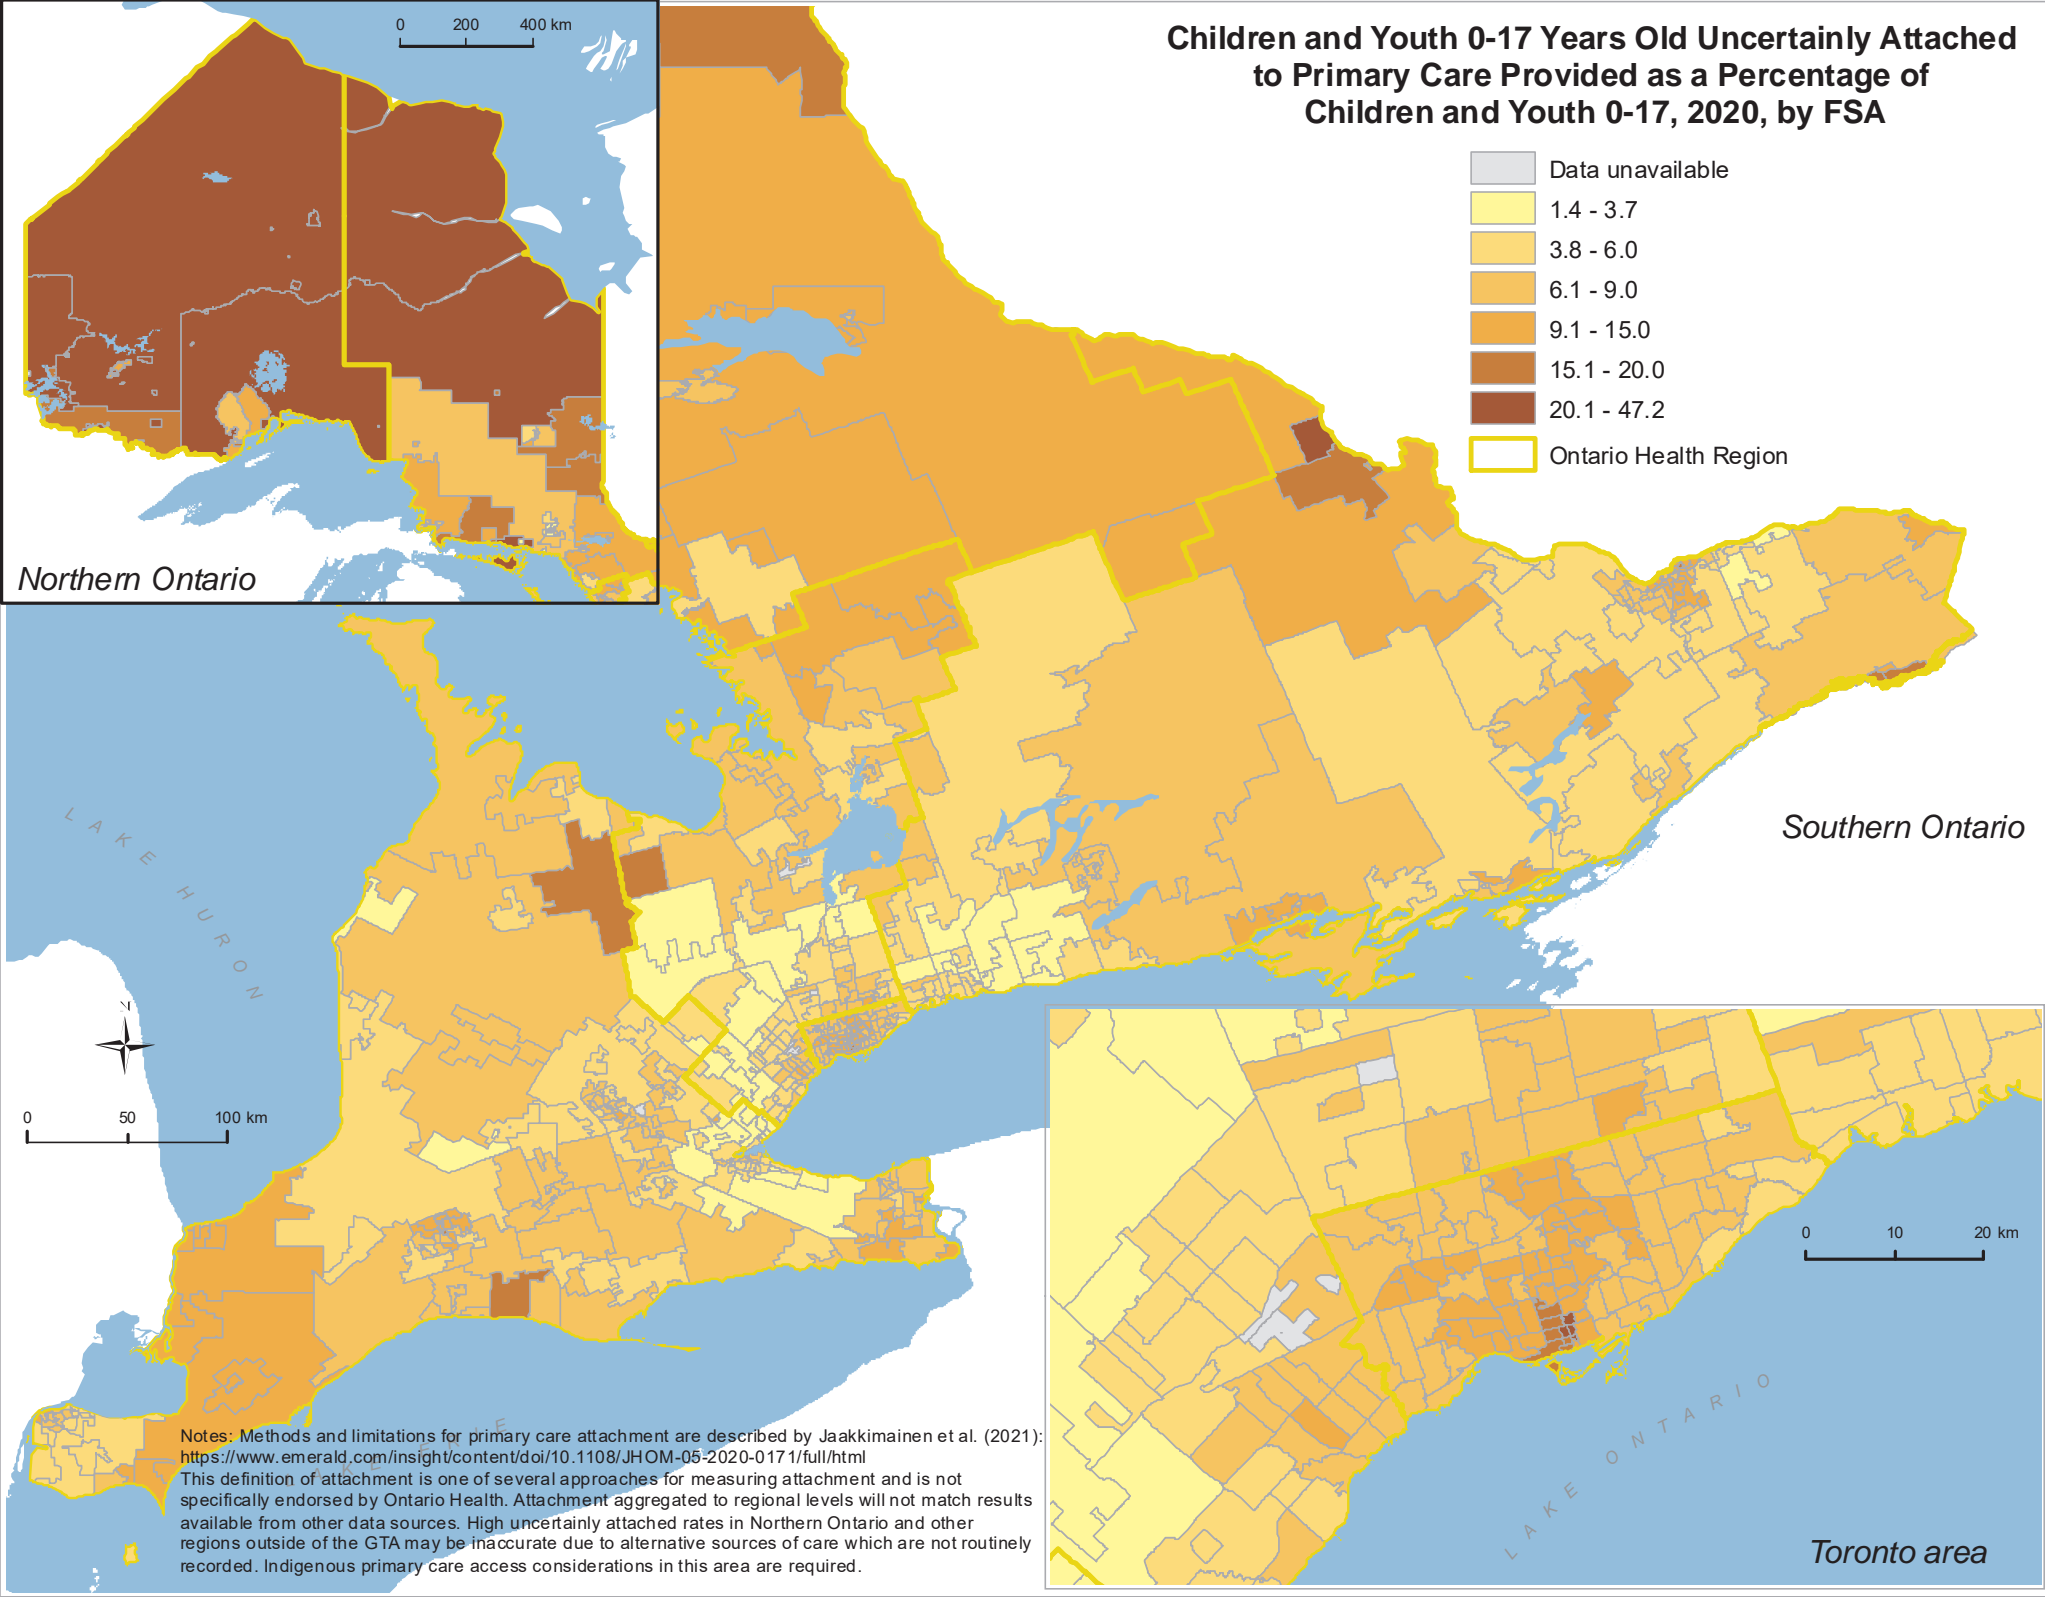

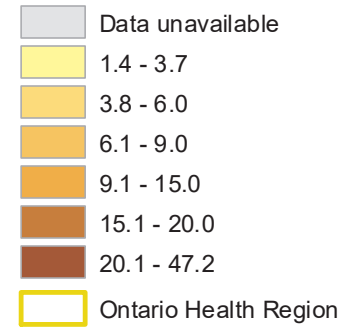

Notes: Methods and limitations for primary care attachment are described by Jaakkimainen et al. (2021); <https://www.emerald.com/insight/content/doi/10.1108/JHOM-05-2020-0171/full/html>
 This definition of attachment is one of several approaches for measuring attachment and is not specifically endorsed by Ontario Health. Attachment aggregated to regional levels will not match results available from other data sources. High uncertainly attached rates in Northern Ontario and other regions outside of the GTA may be inaccurate due to alternative sources of care which are not routinely recorded. Indigenous primary care access considerations in this area are required.
